

BEST AVAILABLE COPYABSTRACT

A sealant for polypropylene consisting essentially of a composition comprising a high-pressure-processed low-density polyethylene (A) having a density of 910 to 930 kg/m³ and an MFR of 0.5 to 20 g/10 min; and an ethylene/ α -olefin copolymer (B) having a density of 860 to less than 890 kg/m³, an MFR of 0.5 to 40 g/10 min and an Mw/Mn of 1.5 to 3, and/or a linear low-density polyethylene (C) having a density of 890 to 940 kg/m³ and an MFR of 0.2 to 30 g/10 min. Further, there is provided a hermetically sealed package that can be easily opened comprising a laminate having a double layer structure such that one side of a sealant layer consisting essentially of the above sealant is overlaid with a resin layer of polypropylene. The package may comprise a cover of a laminate and a cup of a resin layer of polypropylene.
